

bt-LogAnalyzer

The most advanced reporting software available for reading and analyzing Web activity. Seriously.

In a perfect world...

there would be no need to know where and when employees were going on the internet...

It's not a perfect world.

So, for today's world filled with malicious code, illegal file sharing, spyware, adware, hacking, cracking, and Phishing, there has to be a **serious solution**:

bt-LogAnalyzer from Burstek.

Burstek's **bt-LogAnalyzer** offers comprehensive reporting in a concise, browser based format. As a core component of Burstek's Enterprise suite of products, **bt-LogAnalyzer** provides the level of security insight and analysis necessary to **make informed decisions about deployment, use and protection** of a company's Internet and Email resources, and how to optimize these vital resources for **maximum business benefit**.

How bt-LogAnalyzer works:

bt-LogAnalyzer reads logs for all outbound Web activity and generates categorized graphical and numerical reports that either detail or highlight all Web usage within an organization. These **browser-based reports** may be **customized for individuals, departments or Organizational Units**, enabling individual managers to generate desired reports under secure conditions. Managers **enjoy the convenience, efficiency and expediency bt-LogAnalyzer brings to their busy day** by enabling them to view a detailed "**Executive Summary**" report of Web usage only for their department—without having to plow through a stack of paper.

bt-LogAnalyzer reports provide drill down reporting by enterprise, department, business unit and user:

- Enterprise Summary Report
- Management Summary Report
- Risk Analysis Report
- User Audit Detail Report
- Legal Liability Summary Report

What can bt-LogAnalyzer do for you ?

- Active Directory Support:** No need to reinvent the wheel. Utilize your existing AD structure of users and groups to build customized, detailed reports.
- SQL:** bt-LogAnalyzer reads multiple log file formats, from multiple locations, and combines into a single report. Flat files and SQL logging or any ODBC-compliant database are supported.
- Distributed report processing:** Larger organizations can process log data at remote locations transferring only the results for aggregate reporting. This frees network resources while utilizing local computing power and delivers the right reports to the right person.
- Information not just data:** Because Internet abuse is statistically a small part of enterprise use, graphical reporting tends to underemphasize problems. bt-LogAnalyzer's color coded reports visually alert the viewer to potential problems.
- Browser-based reports:** IT can set the criteria for each report once, then department managers can run their own reports, showing only their department, whenever they want, relieving IT of the time consuming task of running reports every time a department needs one.
- Control List:** bt-LogAnalyzer contains a master database of URL's, which includes millions of web sites. Each new entry is analyzed and categorized into 50+ categories. Our Control List Technicians do the analysis so you don't have to waste valuable time defining web content. You also have the ability to create unlimited custom categories!
- Exception Reporting:** Management can gain a concise view of the areas of concern without poring through stacks of reports.
- Employee Records:** Human Resources departments can easily produce and maintain individual employee activity reports as part of their overall employment file.
- Microsoft based technology:** Designed specifically and exclusively for Windows 2000 and up, bt-LogAnalyzer design offers rapid implementation without the bugs associated with non-platform specific applications.

more...

bt-LogAnalyzer

The most advanced reporting software available for reading and analyzing Web activity. Seriously.

Turns data into valuable, actionable information *effortlessly*...

Management can visually ascertain if there is a problem with Web access and if so, where and with whom the problem lies.

With one click, instantly drill down to see a report on the problem user, where, when and how long spent at inappropriate sites.

Concise, graphical overview displays potential legal liabilities and the amount of bandwidth associated with them.
